Really quickly I rounded up a few interesting things about a few of the top technology companies for this year. I wanted to pick a few that might not be what you think of when you think tech, but they are for sure ones that you know.

First up is Amazon, I know that we have referenced them in a few different cases in class, from their website design, to ordering candy bars, but did you know that they also had $280.522 Billion dollars in revenue this past year! Also in staggering numbers they have 840,000 employees and to round out the list of interesting quick facts JAVA is their language of choice with Angular being used for the front end programming.

Next up on the list is Adobe, with a campus close to my own home they make the top of the tech list this year. Adobe made a $11.17 Billion dollar revenue this year and compared to Amazon their employee numbers seem extra small, with 22,635 people working for them. Adobe is not unlike Amazon with Java being their preferred language of choice.

Last on the list I picked one that was still in the top 8 of all tech companies this past year, but maybe not one that you would list in your top picks. Sony, who is the largest music entertainment business, had over 80 Billion dollars in revenue this last year and has 114,400 employees. C++ is used for their software, C# is used for their framework and C++ is used as the dominant language for their game programming.
